Important Characteristics of Structured Data

มิติ (จำนวน column ที่ Data มี)

Dimensionality

↑
คีรศ

Curse of dimensionality

→ ถ้ามีมิติมากเกินไป ก็จะไม่ดี

Sparsity (ความต่างไปล่า, ความเบาบาง)

Only presence counts

Resolution (ความละเอียด) เช่น เวลาเราดูเที่ยวกับพื้นที่

Patterns depend on the scale

Distribution (มีน้ำปักอยู่ที่เดียวกันนี้เป็นไปร่วมกัน หรือ: จุดที่อยู่ห่างกันมากจะบ่งบอกว่าเป็น)

Centrality and dispersion

Data Objects

- Data sets are made up of data objects
→ ເປັນ Data ອຸກ ນີ້ອ່ານຍັງ data point
- A data object represents an entity
- Examples:
 - sales database: customers, store items, sales
 - medical database: patients, treatments
 - university database: students, professors, courses
- Also called *samples*, *examples*, *instances*, *data points*, *objects*, *tuples*
ກົມເພວັນ
- Data objects are described by **attributes**
- Database rows → data objects; columns → attributes

Attributes

→ វិស័យបានចូលរួមនៅក្នុងវគ្គភាពខ្លួន (ប្រើប្រាស់ជំថាម្យាក)

Attribute ລາຍລາອີເວັບໄດ້ແກ່ລາຍງົດ

- Attribute** (or dimensions, features, variables) คือฟีเจอร์ของ object
 - A data field, representing a characteristic or feature of a data object.
 - E.g., *customer_ID, name, address*
 - Types:
 - Nominal (e.g., red, blue)
 - Binary (e.g., {true, false}) ลักษณะของคลังข้อมูล
 - Ordinal (e.g., {freshman, sophomore, junior, senior}) ลำดับ Nominal ก่อ
สามารถเรียงลำดับ
 - Numeric: quantitative จำนวนที่ต้องคำนวณ
 - Interval-scaled: 100°C is interval scales ไม่มี 0 เก็
 - Ratio-scaled: 100°K is ratio scaled since it is twice as high as 50°K มี 0 เก็
 - Q1: Is student ID a nominal, ordinal, or interval-scaled data?
 - Q2: What about eye color? Or color in the color spectrum of physics?

Attribute Types

- **Nominal:** categories, states, or “names of things”
 - *Hair_color* = {*auburn, black, blond, brown, grey, red, white*}
 - marital status, occupation, ID numbers, zip codes
- **Binary**
 - Nominal attribute with only 2 states (0 and 1)
 - Symmetric binary: both outcomes equally important
 - e.g., gender
 - Asymmetric binary: outcomes not equally important.
 - e.g., medical test (positive vs. negative) ឧប្បត្តិរឹង + ឧកភាព់ពាន - ជាបីបានចារាង (6)
 - Convention: assign 1 to most important outcome (e.g., HIV positive)
- **Ordinal**
 - Values have a meaningful order (ranking) but magnitude between successive values is not known
 - *Size* = {*small, medium, large*}, grades, army rankings

Numeric Attribute Types

- Quantity (integer or real-valued)
- **Interval**
 - Measured on a scale of **equal-sized units**
 - Values have order
 - E.g., *temperature in C° or F°, calendar dates*
 - No true zero-point
- **Ratio**
 - Inherent **zero-point**
 - We can speak of values as being an order of magnitude larger than the unit of measurement (10 K° is twice as high as 5 K°).
 - e.g., *temperature in Kelvin, length, counts, monetary quantities*

Discrete vs. Continuous Attributes

Discrete Attribute

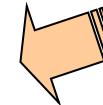

- Has only a finite or countably infinite set of values
 - E.g., zip codes, profession, or the set of words in a collection of documents
- Sometimes, represented as integer variables
- Note: Binary attributes are a special case of discrete attributes

Continuous Attribute

- Has real numbers as attribute values
 - E.g., temperature, height, or weight
- Practically, real values can only be measured and represented using a finite number of digits
- Continuous attributes are typically represented as floating-point variables

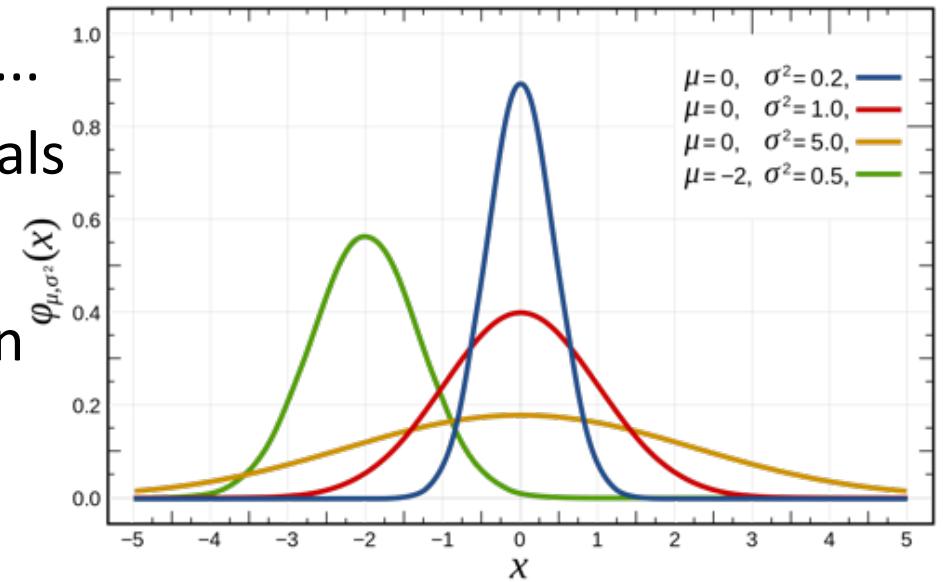

Chapter 2. Getting to Know Your Data

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization
- Measuring Data Similarity and Dissimilarity
- Summary

Basic Statistical Descriptions of Data

- Motivation
 - To better understand the data: central tendency, variation and spread
- Data dispersion characteristics
 - Median, max, min, quantiles, outliers, variance, ...
- Numerical dimensions correspond to sorted intervals
 - Data dispersion:
 - Analyzed with multiple granularities of precision
 - Boxplot or quantile analysis on sorted intervals
- Dispersion analysis on computed measures
 - Folding measures into numerical dimensions
 - Boxplot or quantile analysis on the transformed cube

Measuring the Central Tendency: (1) Mean

- Mean (algebraic measure) (sample vs. population):

Note: n is sample size and N is population size.

$$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i \quad \mu = \frac{\sum x}{N}$$

- Weighted arithmetic mean:

$$\bar{x} = \frac{\sum_{i=1}^n w_i x_i}{\sum_{i=1}^n w_i}$$

- Trimmed mean:

- Chopping extreme values (e.g., Olympics gymnastics score computation)

Measuring the Central Tendency: (2) Median

- Median:

- Middle value if odd number of values, or average of the middle two values otherwise
- Estimated by interpolation (for *grouped data*):

age	frequency
1–5	200
6–15	450
16–20	300
21–50	1500
51–80	700
81–110	44

Approximate
median

Sum before the median interval

Interval width ($L_2 - L_1$)

$$\text{median} = L_1 + \left(\frac{n/2 - (\sum \text{freq})_l}{\text{freq}_{\text{median}}} \right) \text{width}$$

Low interval limit

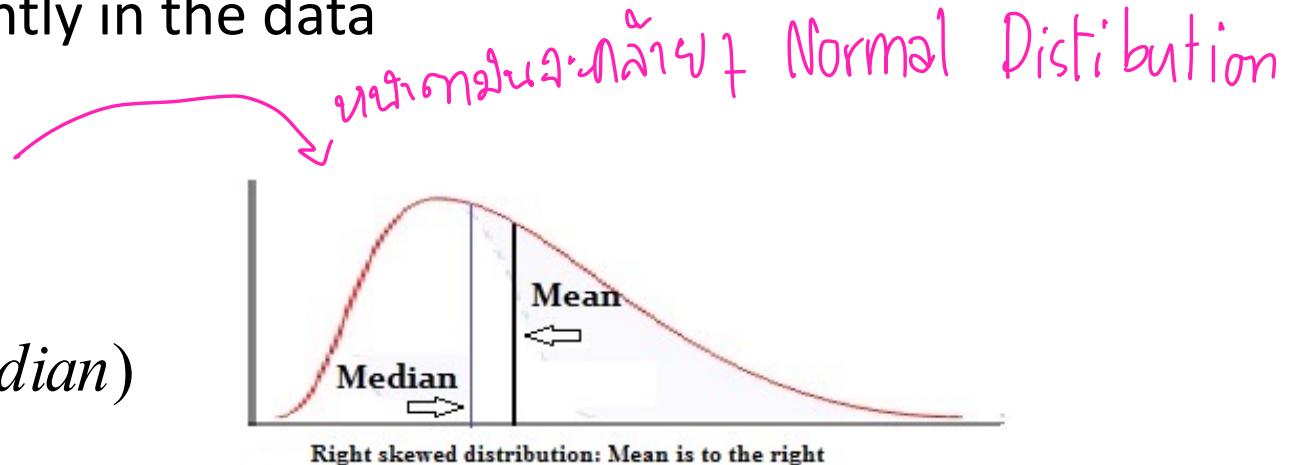

Measuring the Central Tendency: (3) Mode

- Mode: Value that occurs most frequently in the data

- Unimodal → មែនមួយគុណមាត្រីតែ ១ ភ័យ

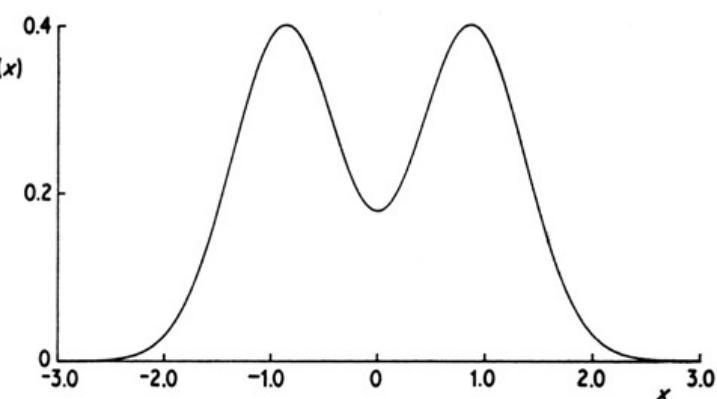

- Empirical formula:

$$mean - mode = 3 \times (mean - median)$$

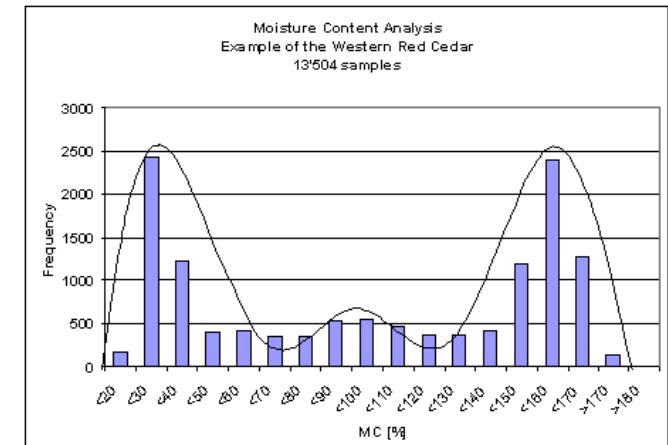

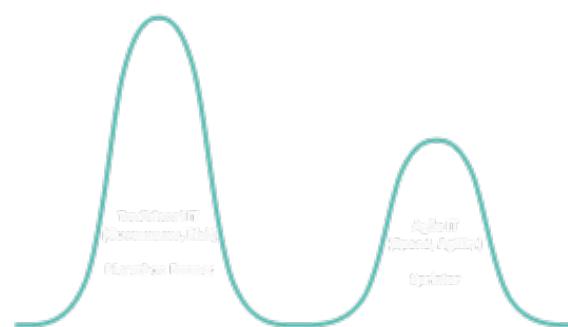

- Multi-modal → មែនមួយរាងកាលៗ

- Bimodal

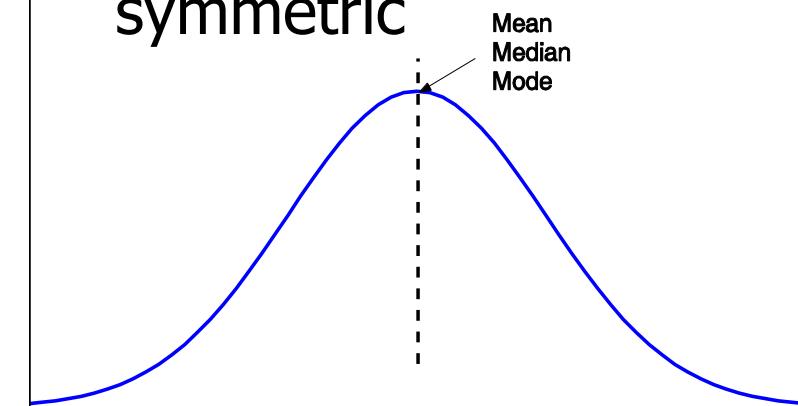

- Trimodal

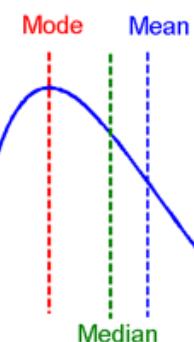

Symmetric vs. Skewed Data

- Median, mean and mode of symmetric, positively and negatively skewed data

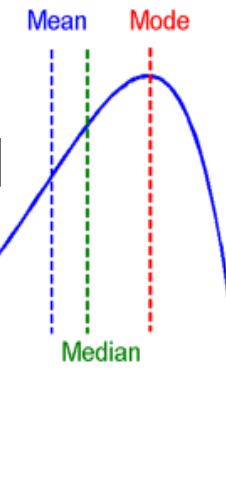

symmetric

positively skewed

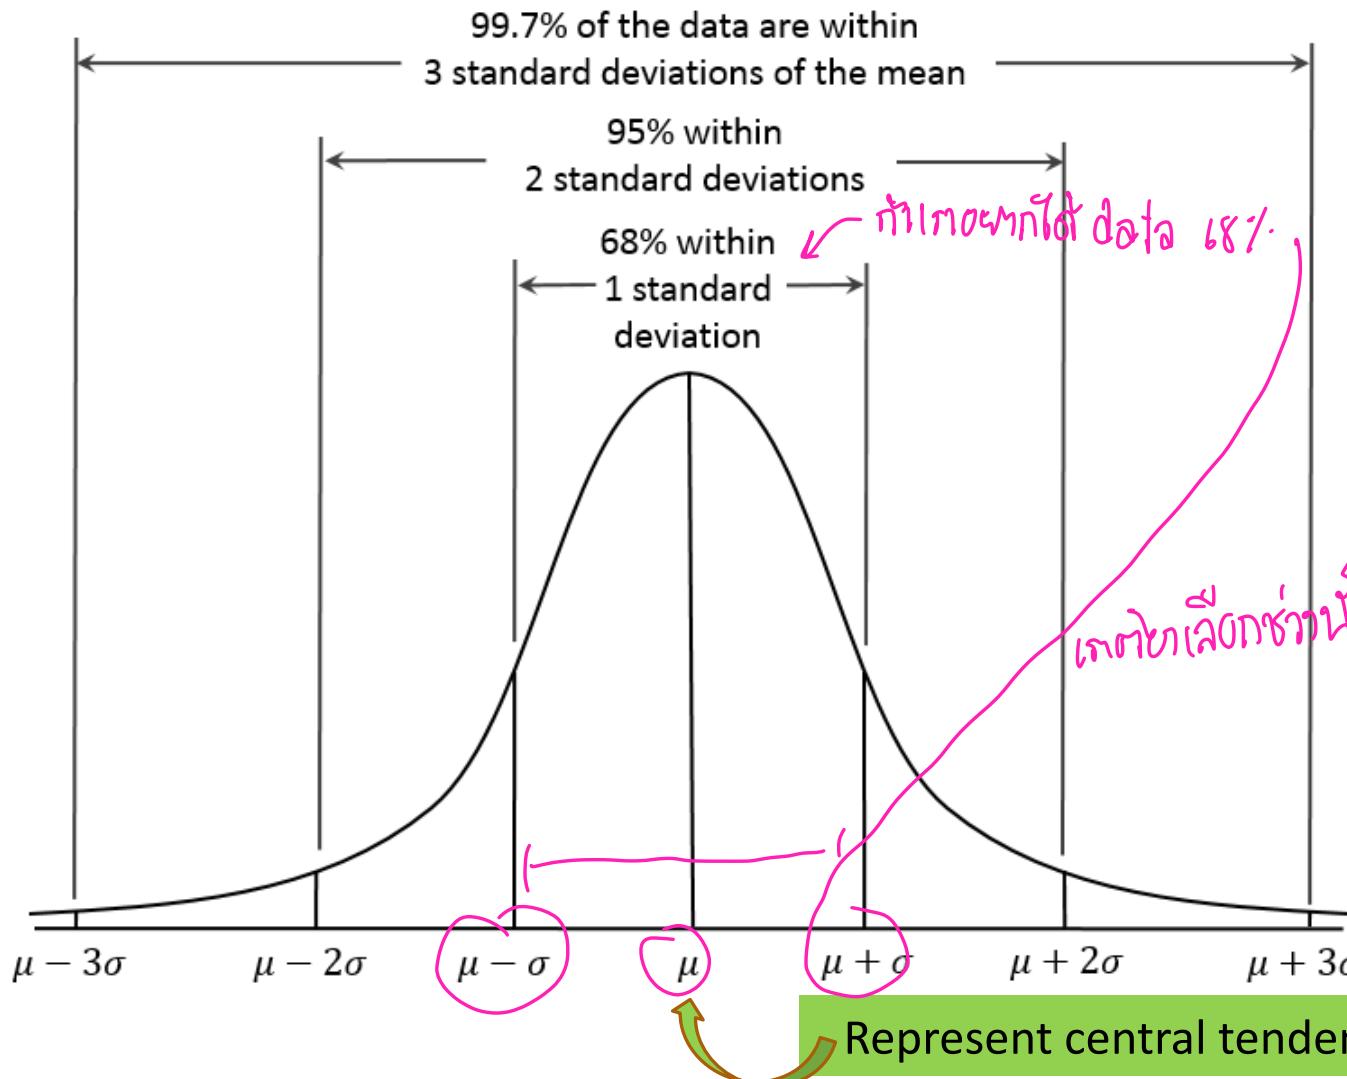

negatively skewed

Properties of Normal Distribution Curve

← ----- Represent data dispersion, spread ----- →

Measures Data Distribution: Variance and Standard Deviation

- ❑ Variance and standard deviation (*sample: s, population: σ*)

- ❑ **Variance:** (algebraic, scalable computation)

- ❑ Q: Can you compute it incrementally and efficiently?

$$s^2 = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2 = \frac{1}{n-1} \left[\sum_{i=1}^n x_i^2 - \frac{1}{n} \left(\sum_{i=1}^n x_i \right)^2 \right]$$

$$\sigma^2 = \frac{1}{N} \sum_{i=1}^n (x_i - \mu)^2 = \frac{1}{N} \sum_{i=1}^n x_i^2 - \mu^2$$

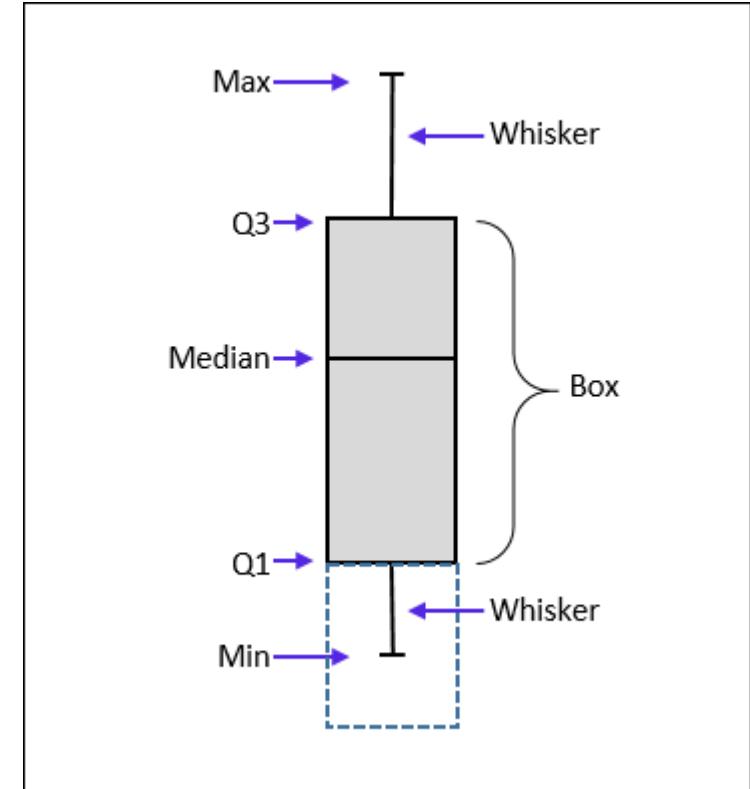

- ❑ **Standard deviation s (or σ)** is the square root of variance s^2 (or σ^2)

Graphic Displays of Basic Statistical Descriptions

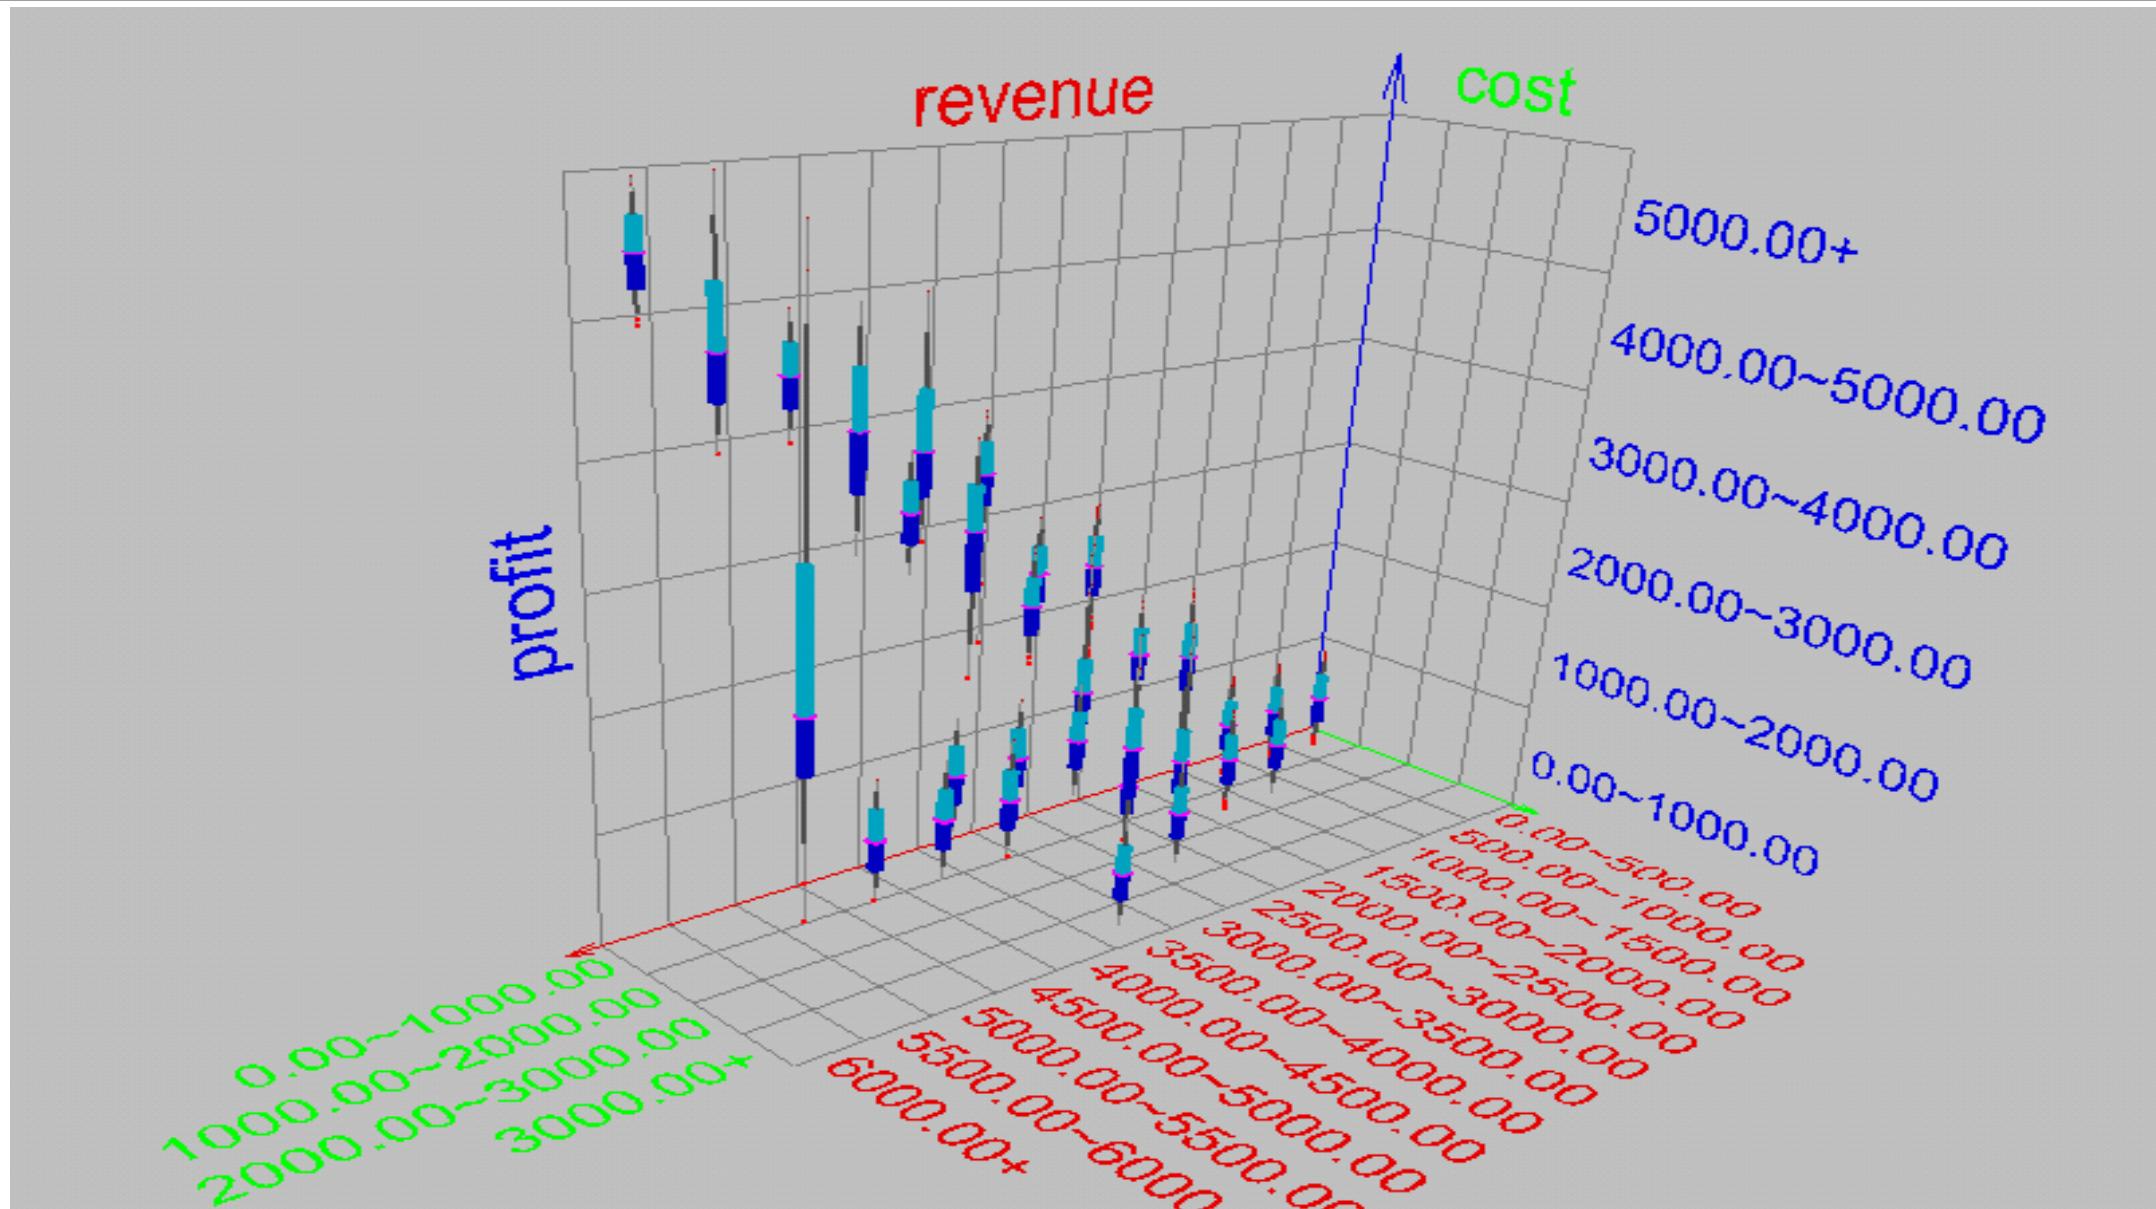

- Boxplot:** graphic display of five-number summary *Medien, Q₁, Q₂, Max, Min, outlier*
- Histogram:** x-axis are values, y-axis repres. frequencies
- Quantile plot:** each value x_i is paired with f_i indicating that approximately $100 f_i \%$ of data are $\leq x_i$
- Quantile-quantile (q-q) plot:** graphs the quantiles of one univariant distribution against the corresponding quantiles of another
- Scatter plot:** each pair of values is a pair of coordinates and plotted as points in the plane

Measuring the Dispersion of Data: Quartiles & Boxplots

- **Quartiles:** Q_1 (25^{th} percentile), Q_3 (75^{th} percentile)
- **Inter-quartile range:** $\text{IQR} = Q_3 - Q_1$
- **Five number summary:** min, Q_1 , median, Q_3 , max
- **Boxplot:** Data is represented with a box
 - Q_1 , Q_3 , IQR: The ends of the box are at the first and third quartiles, i.e., the height of the box is IQR
 - Median (Q_2) is marked by a line within the box
 - Whiskers: two lines outside the box extended to Minimum and Maximum
 - Outliers: points beyond a specified outlier threshold, plotted individually
 - **Outlier:** usually, a value higher/lower than $1.5 \times \text{IQR}$

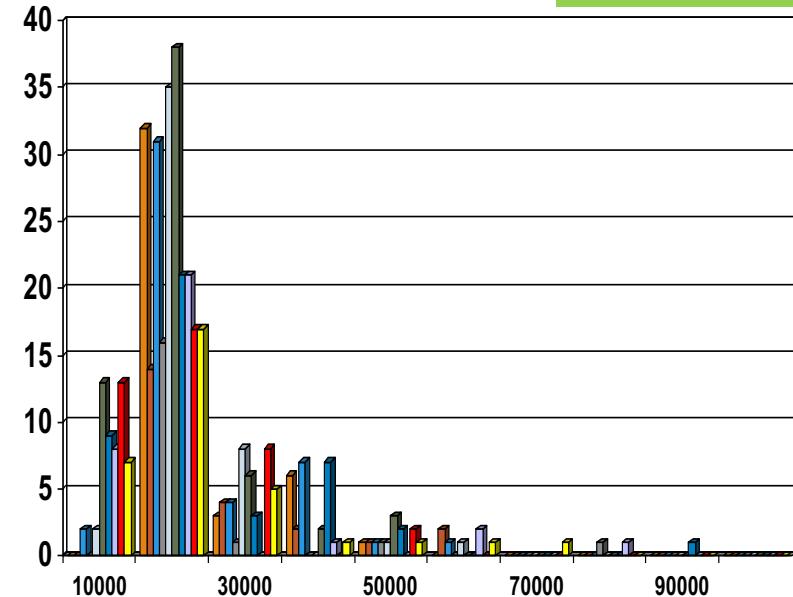

Visualization of Data Dispersion: 3-D Boxplots

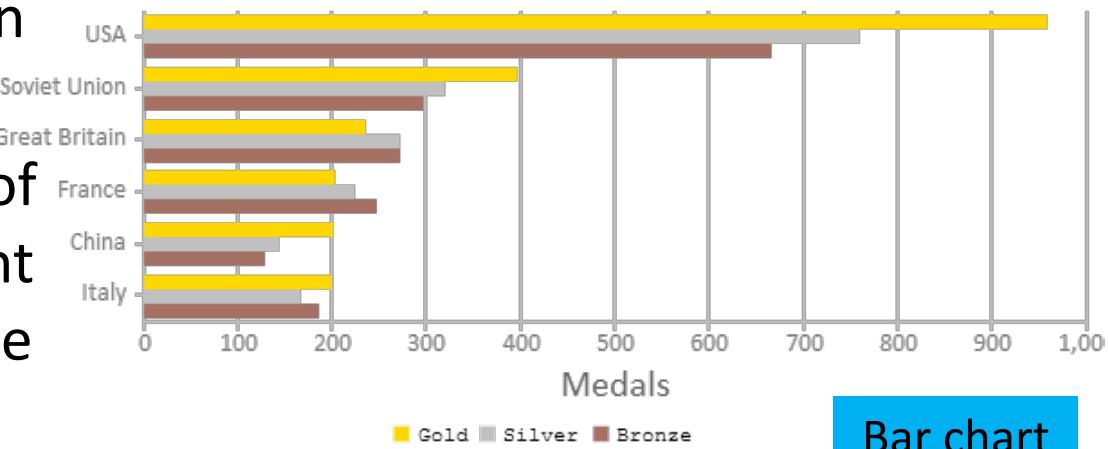

Histogram Analysis

- ❑ Histogram: Graph display of tabulated frequencies, shown as bars
- ❑ Differences between histograms and bar charts
 - ❑ Histograms are used to show distributions of variables while bar charts are used to compare variables
 - ❑ Histograms plot binned quantitative data while bar charts plot categorical data
 - ❑ Bars can be reordered in bar charts but not in histograms
 - ❑ Differs from a bar chart in that it is the area of the bar that denotes the value, not the height as in bar charts, a crucial distinction when the categories are not of uniform width

Histogram

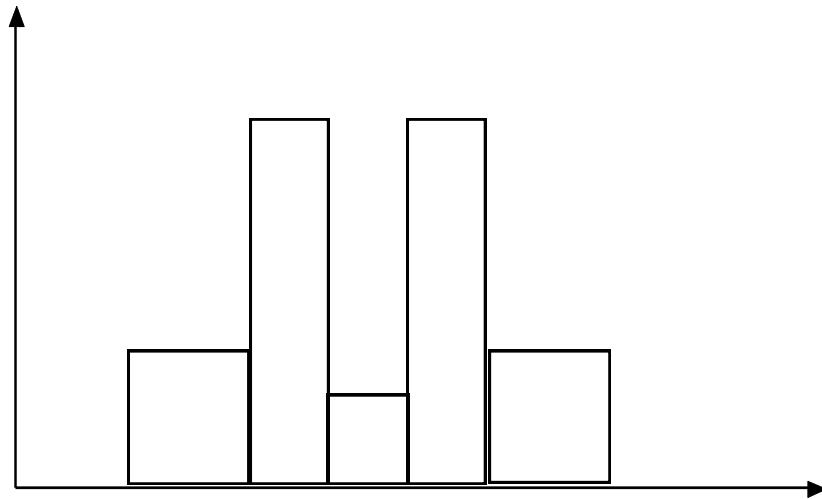

Olympic Medals of all Times (till 2012 Olympics)

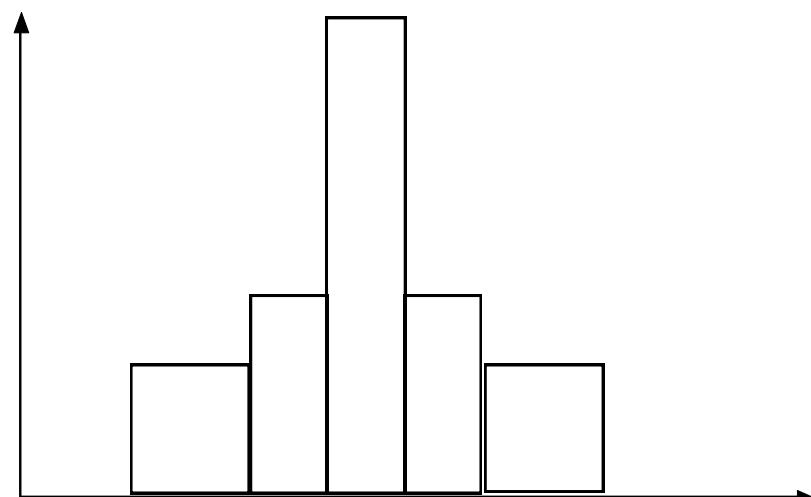

Bar chart

Histograms Often Tell More than Boxplots

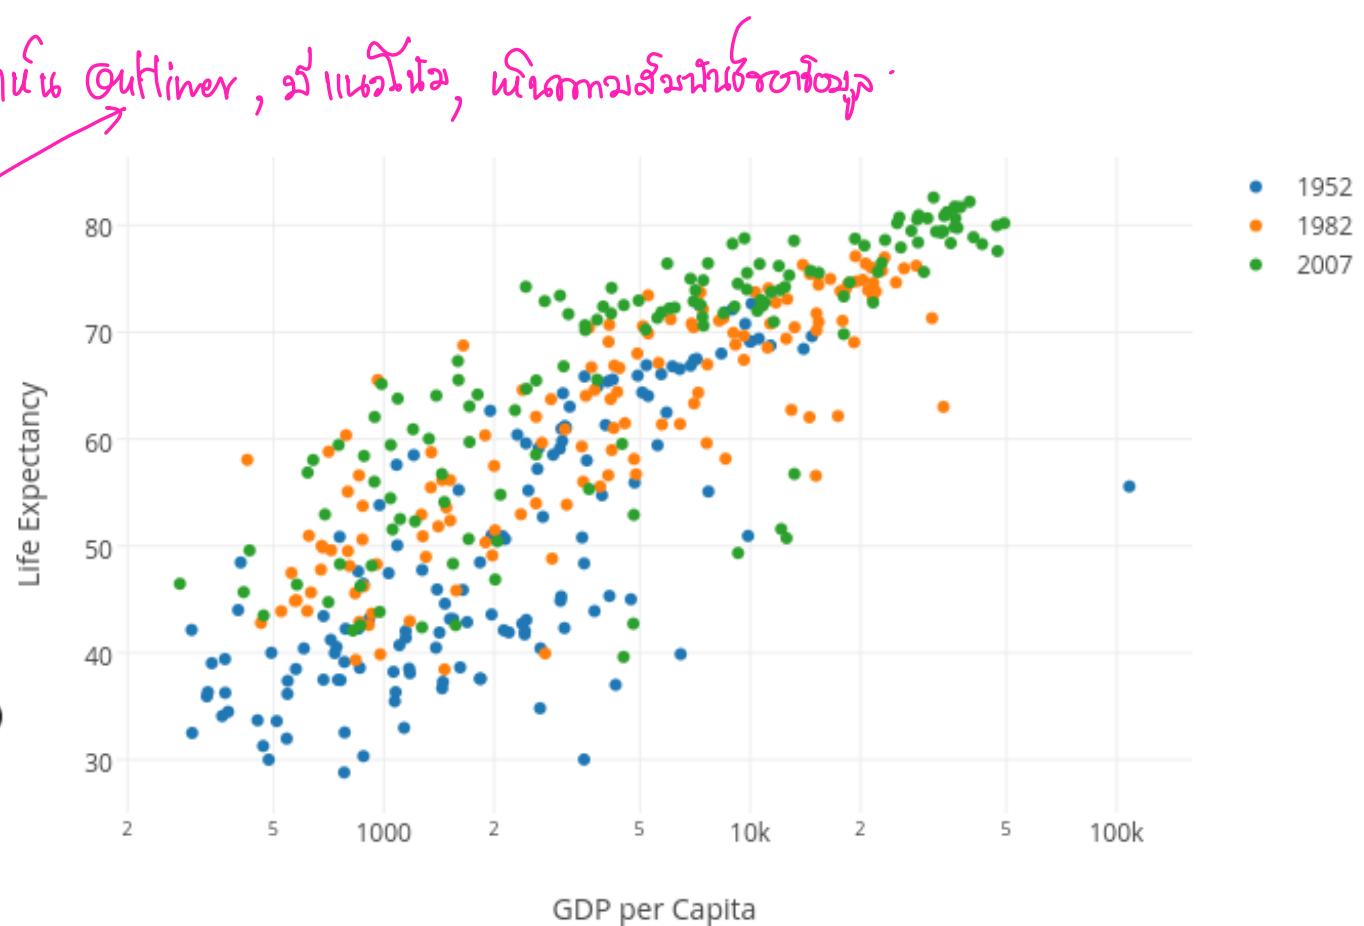

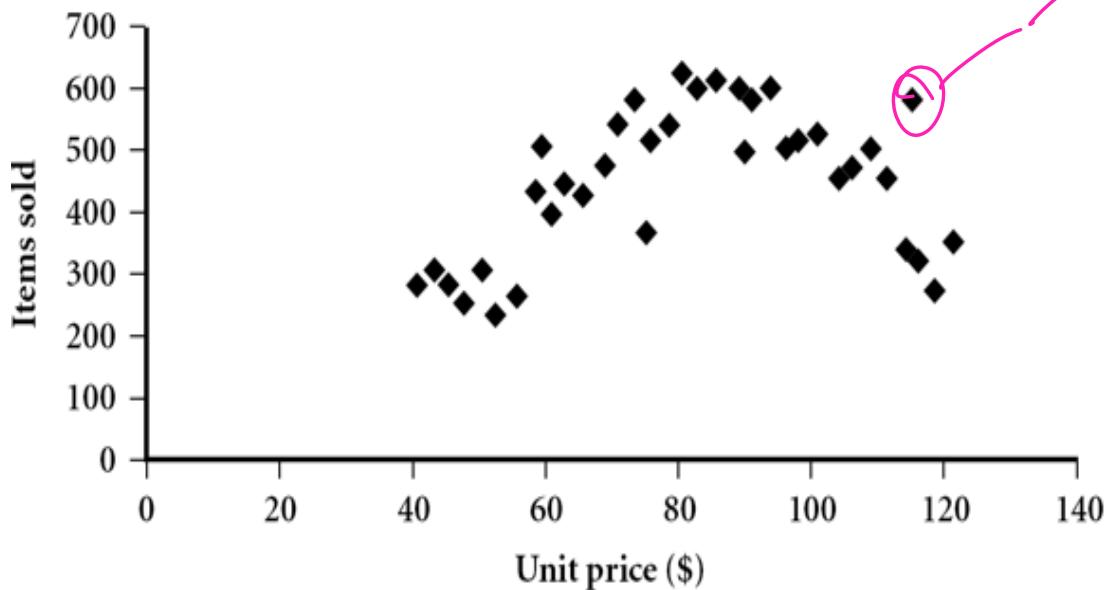

- ❑ The two histograms shown in the left may have the same boxplot representation
- ❑ The same values for: min, Q1, median, Q3, max
- ❑ But they have rather different data distributions

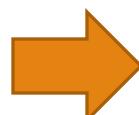

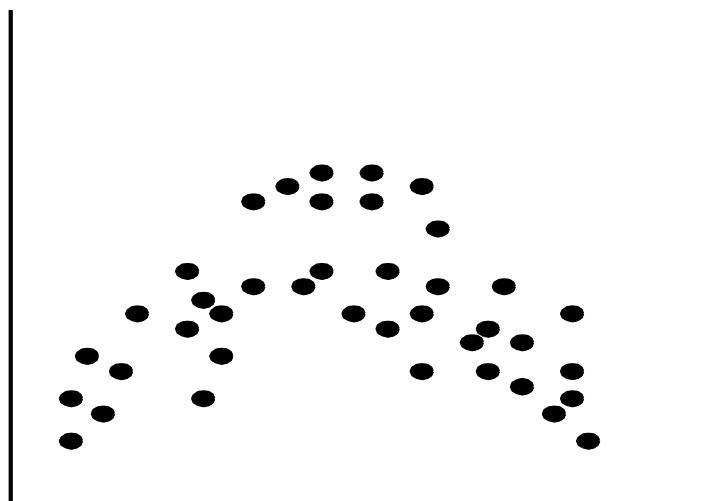

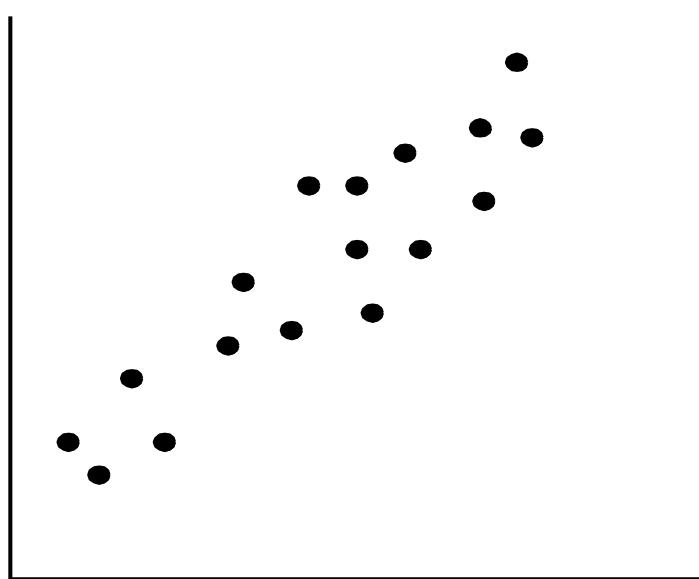

Scatter plot

- Provides a first look at bivariate data to see clusters of points, outliers, etc.
- Each pair of values is treated as a pair of coordinates and plotted as points in the plane

ເບີນກຳລົງກາໄສໂລງ , ເນັ້ນຕາງດາຈາຍ , ແມ່ນ Outlier , ວິໄລວິນ່າ , ໜີ້ແກ່ມາສົ່ງໃຫ້ຮ່ວມມືກູ່ .

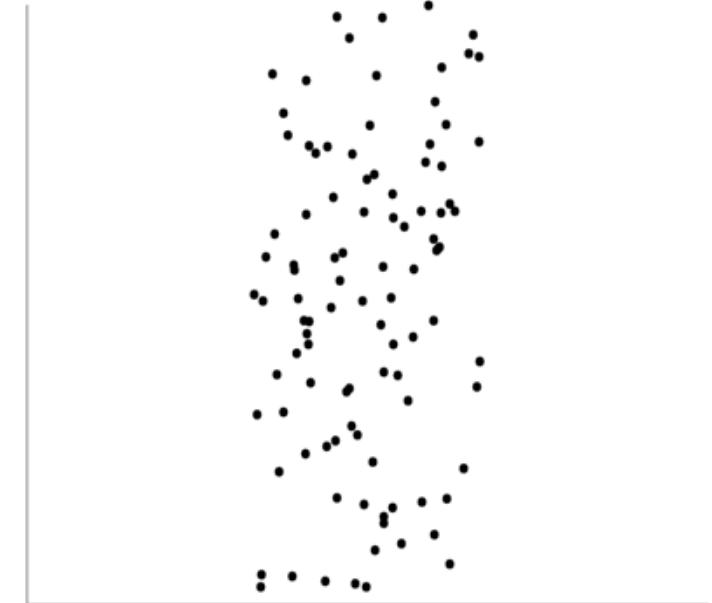

Positively and Negatively Correlated Data

- The left half fragment is positively correlated
- The right half is negative correlated

Uncorrelated Data

Chapter 2. Getting to Know Your Data

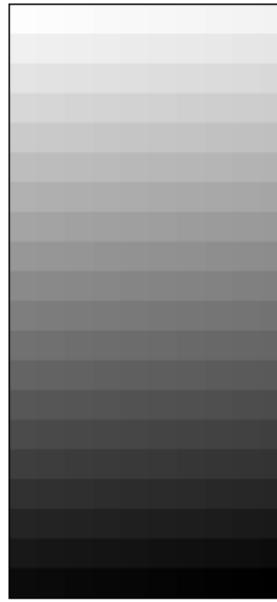

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization 
- Measuring Data Similarity and Dissimilarity
- Summary

Data Visualization

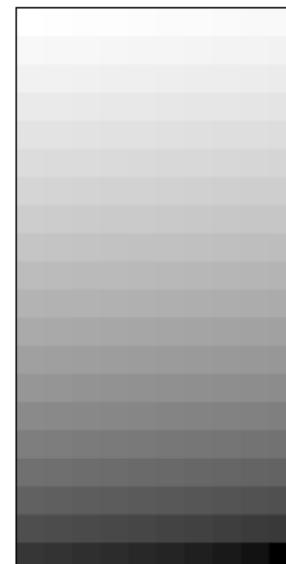

- Why data visualization?
 - Gain insight into an information space by mapping data onto graphical primitives
 - Provide qualitative overview of large data sets
 - Search for patterns, trends, structure, irregularities, relationships among data
 - Help find interesting regions and suitable parameters for further quantitative analysis
 - Provide a visual proof of computer representations derived
- Categorization of visualization methods:
 - Pixel-oriented visualization techniques
 - Geometric projection visualization techniques
 - Icon-based visualization techniques
 - Hierarchical visualization techniques
 - Visualizing complex data and relations

Pixel-Oriented Visualization Techniques

- For a data set of m dimensions, create m windows on the screen, one for each dimension
- The m dimension values of a record are mapped to m pixels at the corresponding positions in the windows
- The colors of the pixels reflect the corresponding values

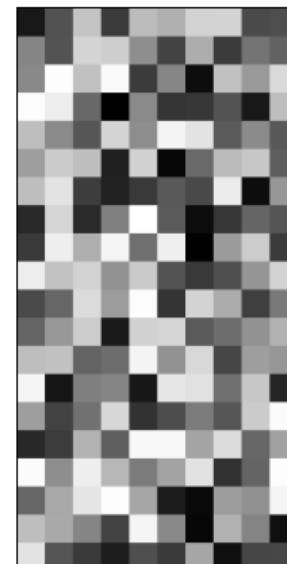

(a) Income

(b) Credit Limit

(c) transaction volume

(d) age

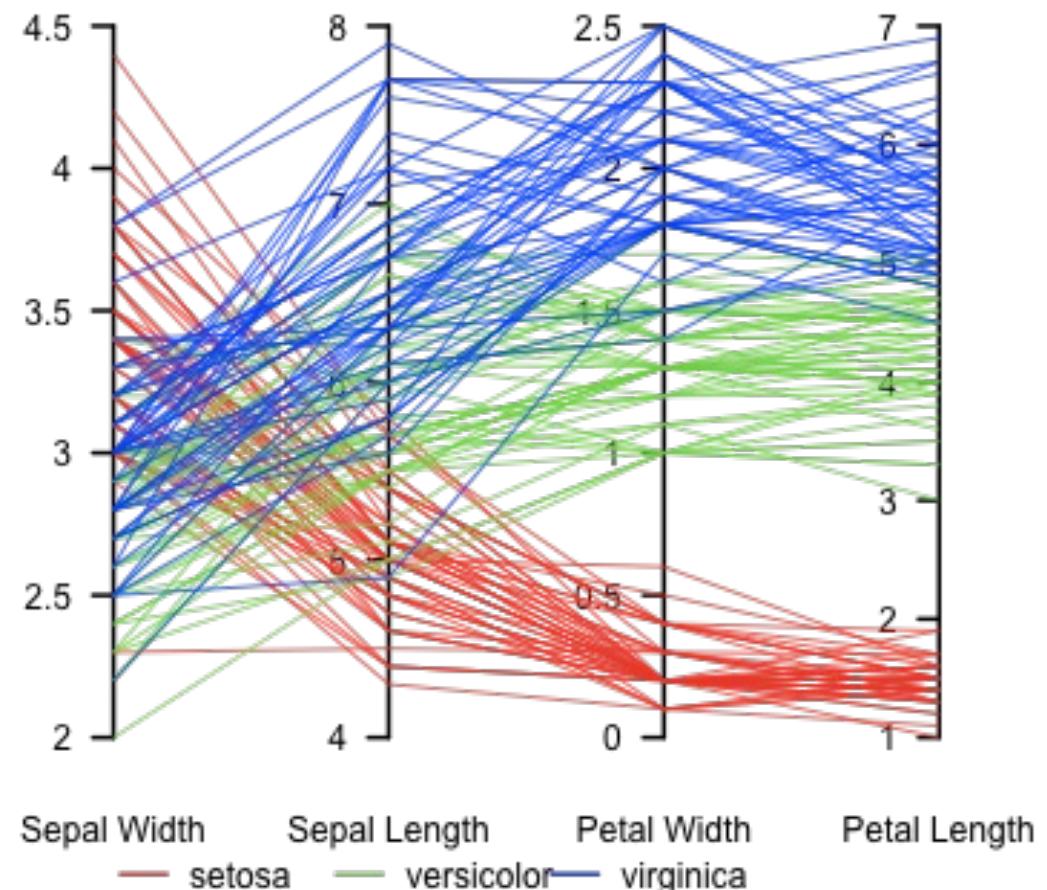

របៀបក្រោមនៃបច្ចេកទេស

Parallel Coordinates

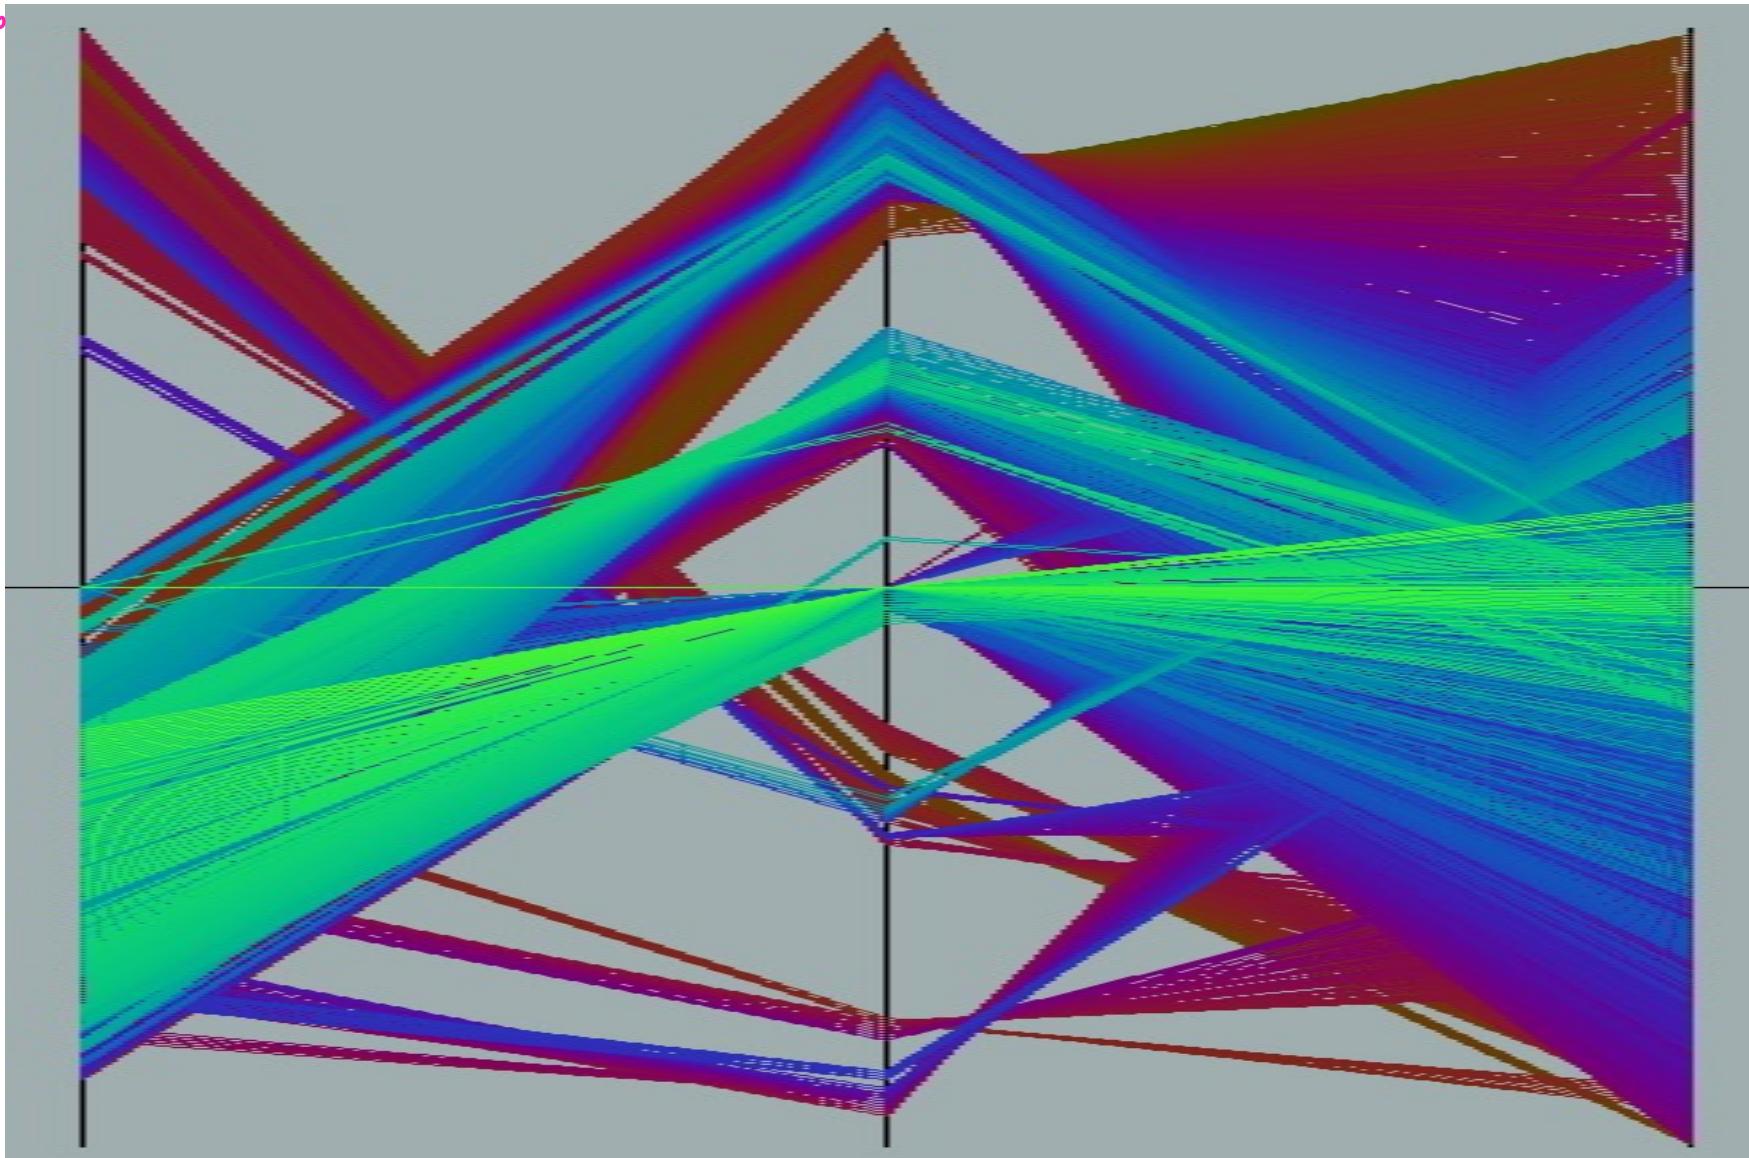

- n equidistant axes which are parallel to one of the screen axes and correspond to the attributes
- The axes are scaled to the [minimum, maximum]: range of the corresponding attribute
- Every data item corresponds to a polygonal line which intersects each of the axes at the point which corresponds to the value for the attribute

Parallel coordinate plot, Fisher's Iris data

Parallel Coordinates of a Data Set

Data from 2006
→

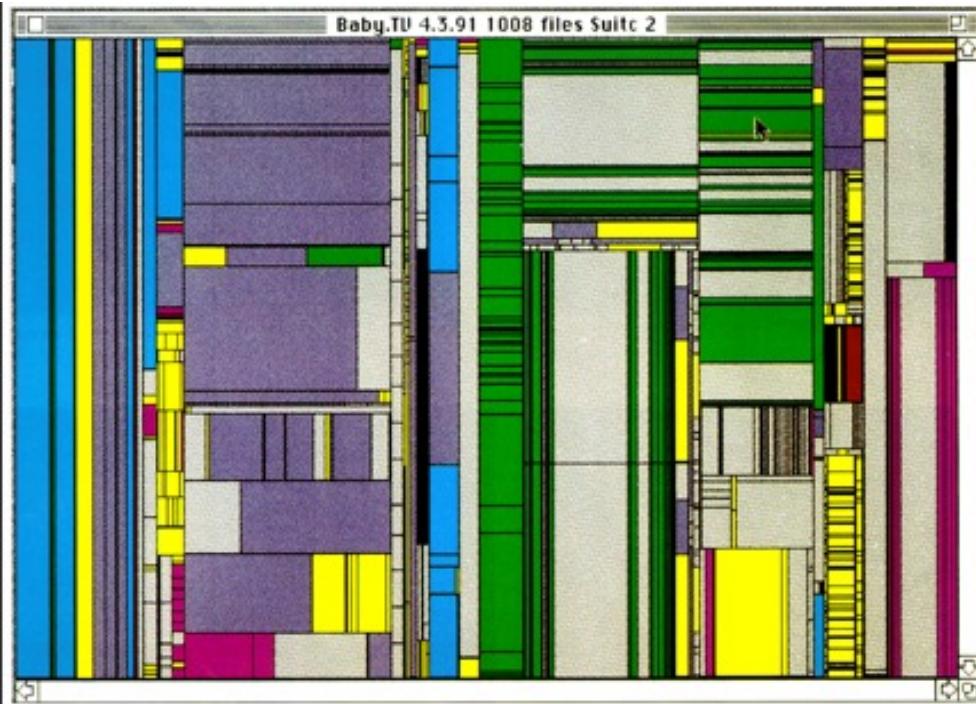

ເກມ:ແມ່ນໆນີ້ ດອກໃນ 100% ຜົນຂອງ class ແຕ່ຈະ: Class ຂີ: ໄປດ້ວຍນາດຫຼາຍ

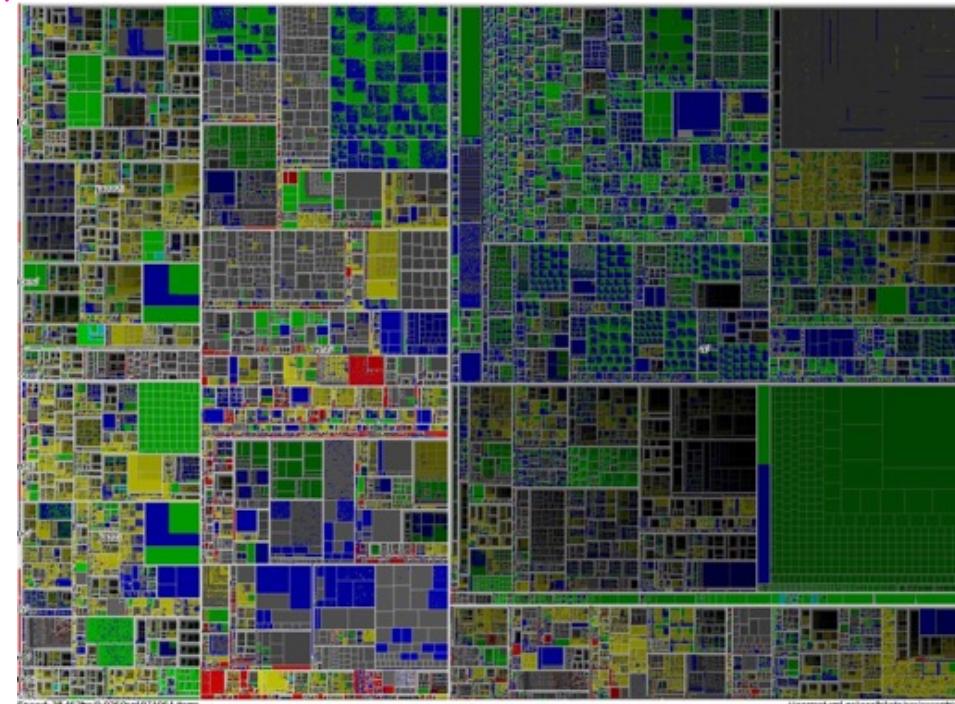

Tree-Map

- Screen-filling method which uses a hierarchical partitioning of the screen into regions depending on the attribute values
- The x- and y-dimension of the screen are partitioned alternately according to the attribute values (classes)

ຕົວຢານີ້ໄວ້!
ຕົວຢານີ້ໄວ້!

Schneiderman@UMD: Tree-Map to support large data sets of a million items

Visualizing Complex Data and Relations: Tag Cloud

word cloud

- Tag cloud: Visualizing user-generated tags
- The importance of tag is represented by font size/color
- Popularly used to visualize word/phrase distributions

KDD 2013 Research Paper Title Tag Cloud

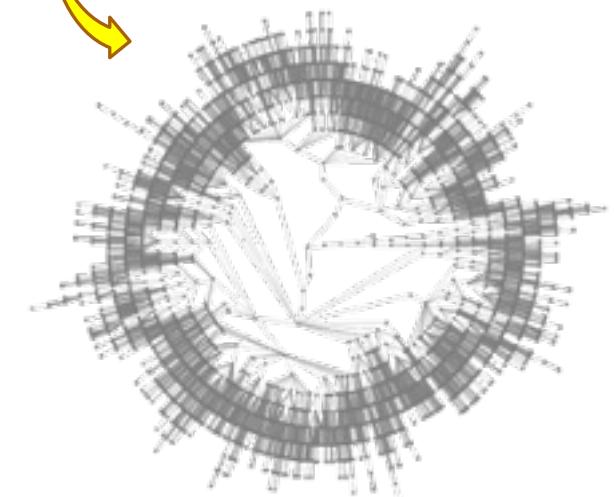

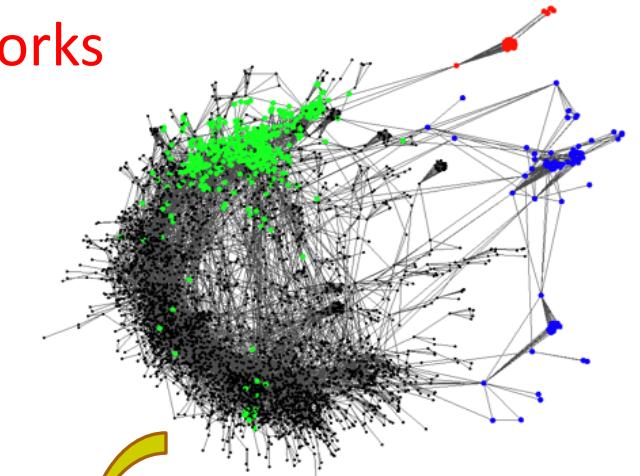

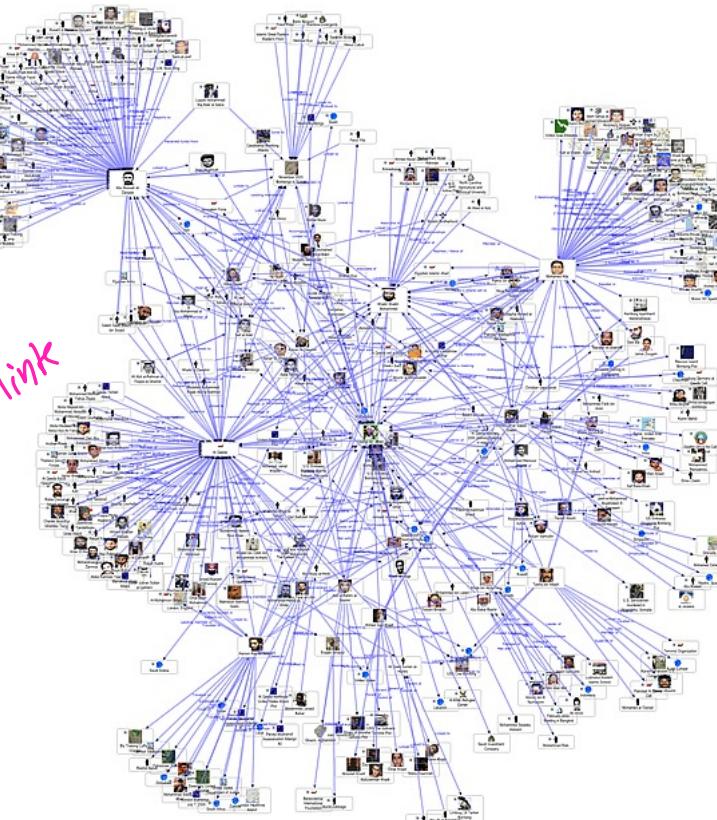

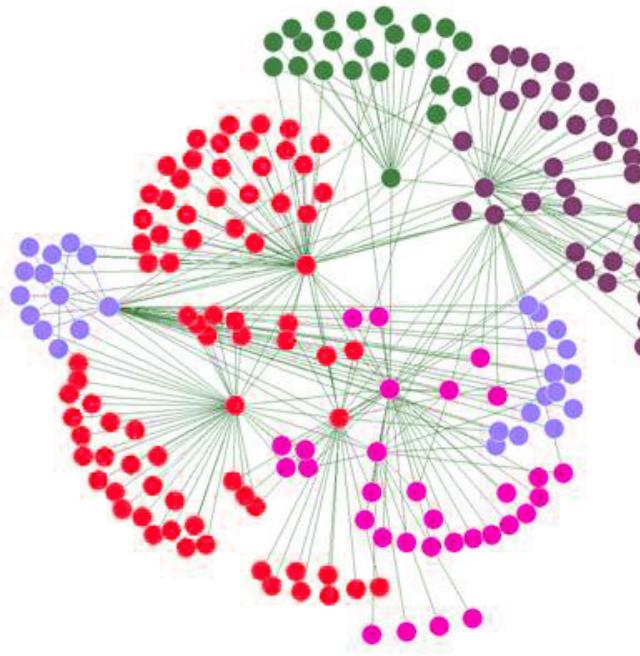

บ่ดี (เจ๊ๆ) ຕິ Negative (ໜົດ)

Newsmapper: Google News Stories in 2005

Visualizing Complex Data and Relations: Social Networks

- Visualizing non-numerical data: social and information networks

Chapter 2. Getting to Know Your Data

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization
- Measuring Data Similarity and Dissimilarity
- Summary

សិក្សាភាសា

Similarity, Dissimilarity, and Proximity

ព័ត៌មានខ្លួន

□ Similarity measure or similarity function

- A real-valued function that quantifies the similarity between two objects
- Measure how two data objects are alike: The higher value, the more alike
- Often falls in the range $[0,1]$: 0: no similarity; 1: completely similar

□ Dissimilarity (or distance) measure

យើងមិនរាយ
អាមេរិកមិនអាចគ្រប់គ្រងទារណាតែង { លោកស្រីរាយ មានអ្នក }
អាមេរិកមិនអាចគ្រប់គ្រងទារណាតែង { លោកស្រីរាយ មានអ្នក }

- Numerical measure of how different two data objects are
- In some sense, the inverse of similarity: The lower, the more alike
- Minimum dissimilarity is often 0 (i.e., completely similar)
- Range $[0, 1]$ or $[0, \infty)$, depending on the definition

□ Proximity usually refers to either similarity or dissimilarity

Data Matrix and Dissimilarity Matrix

- Data matrix

- A data matrix of n data points with l dimensions

- Dissimilarity (distance) matrix

- n data points, but registers only the distance $d(i, j)$ (typically metric)

- Usually symmetric, thus a triangular matrix

- **Distance functions** are usually different for real, boolean, categorical, ordinal, ratio, and vector variables

- Weights can be associated with different variables based on applications and data semantics

$$D = \begin{pmatrix} x_{11} & x_{12} & \dots & x_{1l} \\ x_{21} & x_{22} & \dots & x_{2l} \\ \vdots & \vdots & \ddots & \vdots \\ x_{n1} & x_{n2} & \dots & x_{nl} \end{pmatrix}$$

$$\begin{array}{ccccc} & 0 & & & \\ & d(2,1) & 0 & & \\ & \vdots & \vdots & \ddots & \\ & d(n,1) & d(n,2) & \dots & 0 \end{array}$$

Standardizing Numeric Data

- Z-score:

$$z = \frac{x - \mu}{\sigma}$$

- X: raw score to be standardized, μ : mean of the population, σ : standard deviation
- the distance between the raw score and the population mean in units of the standard deviation
- negative when the raw score is below the mean, “+” when above
- An alternative way: Calculate the mean absolute deviation

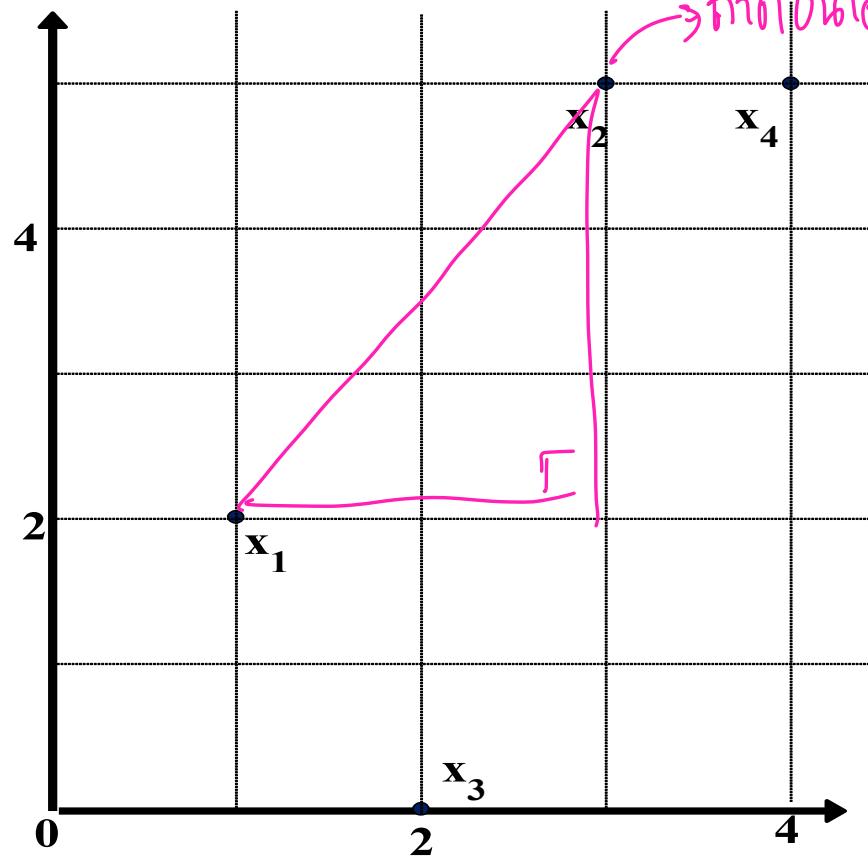

$$s_f = \frac{1}{n}(|x_{1f} - m_f| + |x_{2f} - m_f| + \dots + |x_{nf} - m_f|)$$

where

$$m_f = \frac{1}{n}(x_{1f} + x_{2f} + \dots + x_{nf})$$

- standardized measure (z-score):
$$z_{if} = \frac{x_{if} - m_f}{s_f}$$
- Using mean absolute deviation is more robust than using standard deviation

Example: Data Matrix and Dissimilarity Matrix

คำนวณต่างๆ เท่าไร
พิจารณาในกรณี

x_3	2.24	5.1	0	
x_4	4.24	1	5.39	0

บวกกัน

Distance on Numeric Data: Minkowski Distance

- Minkowski distance: A popular distance measure

$$d(i, j) = \sqrt[p]{|x_{i1} - x_{j1}|^p + |x_{i2} - x_{j2}|^p + \dots + |x_{il} - x_{jl}|^p}$$

where $i = (x_{i1}, x_{i2}, \dots, x_{il})$ and $j = (x_{j1}, x_{j2}, \dots, x_{jl})$ are two l -dimensional data objects, and p is the order (the distance so defined is also called L- p norm)

- Properties ព័ត៌មាននៃ distance តួចរាបស្ថិតនូវការបង្កើត 3 វិធីការ

- $d(i, j) > 0$ if $i \neq j$, and $d(i, i) = 0$ (Positivity)
- $d(i, j) = d(j, i)$ (Symmetry)
- $d(i, j) \leq d(i, k) + d(k, j)$ (Triangle Inequality) ដើម្បី 1 ឧទាហរណ៍ដែលបញ្ជាផ្ទៃនេះគឺជាពាណិជ្ជកម្មនៅក្នុងការបង្កើត
- A distance that satisfies these properties is a metric
- Note: There are nonmetric dissimilarities, e.g., set differences

Special Cases of Minkowski Distance

- $p = 1$: (L_1 norm) Manhattan (or city block) distance
 - E.g., the Hamming distance: the number of bits that are different between two binary vectors

$$d(i, j) = |x_{i1} - x_{j1}| + |x_{i2} - x_{j2}| + \dots + |x_{il} - x_{jl}|$$

- $p = 2$: (L_2 norm) Euclidean distance

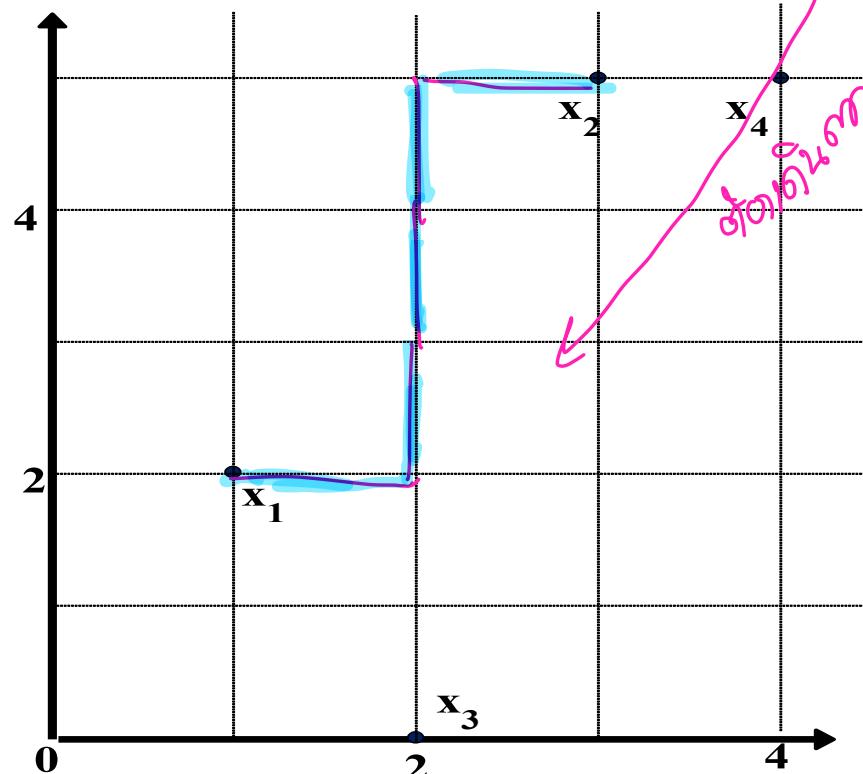

$$d(i, j) = \sqrt{|x_{i1} - x_{j1}|^2 + |x_{i2} - x_{j2}|^2 + \dots + |x_{il} - x_{jl}|^2}$$

- $p \rightarrow \infty$: (L_{\max} norm, L_∞ norm) “supremum” distance
 - The maximum difference between any component (attribute) of the vectors

$$d(i, j) = \lim_{p \rightarrow \infty} \sqrt[p]{|x_{i1} - x_{j1}|^p + |x_{i2} - x_{j2}|^p + \dots + |x_{il} - x_{jl}|^p} = \max_{f=1}^l |x_{if} - x_{jf}|$$

Example: Minkowski Distance at Special Cases

point	attribute 1	attribute 2

Proximity Measure for Binary Attributes

- A contingency table for binary data

		Object <i>j</i>		sum
		1	0	
Object <i>i</i>	1	<i>q</i>	<i>r</i>	<i>q</i> + <i>r</i>
	0	<i>s</i>	<i>t</i>	<i>s</i> + <i>t</i>
sum	<i>q</i> + <i>s</i>	<i>r</i> + <i>t</i>	<i>p</i>	

$$q = 1$$

$$r = 2$$

$$s = 1$$

$$t = 0$$

$$d(i, j) = \frac{r + s}{q + r + s + t}$$

$$d(i, j) = \frac{r + s}{q + r + s}$$

- Distance measure for symmetric binary variables

- Distance measure for asymmetric binary variables:

- Jaccard coefficient (*similarity* measure for

asymmetric binary variables):

$$sim_{Jaccard}(i, j) = \frac{q}{q + r + s}$$

- Note: Jaccard coefficient is the same as

(a concept discussed in Pattern Discovery)

$$coherence(i, j) = \frac{sup(i, j)}{sup(i) + sup(j) - sup(i, j)} = \frac{q}{(q + r) + (q + s) - q}$$

Example: Dissimilarity between Asymmetric Binary Variables

Name	Gender	Fever	Cough	Test-1	Test-2	Test-3	Test-4
Jack	M	Y	N	P	N	N	N
Mary	F	Y	N	P	N	P	N
Jim	M	Y	P	N	N	N	N

- Gender is a symmetric attribute (not counted in)
- The remaining attributes are asymmetric binary
- Let the values Y and P be 1, and the value N be 0
- Distance: $d(i, j) = \frac{r + s}{q + r + s}$

$$d(jack, mary) = \frac{0+1}{2+0+1} = 0.33$$

$$d(jack, jim) = \frac{1+1}{1+1+1} = 0.67$$

$$d(jim, mary) = \frac{1+2}{1+1+2} = 0.75$$

		Mary

Proximity Measure for Categorical Attributes

- Categorical data, also called nominal attributes
 - Example: Color (red, yellow, blue, green), profession, etc.
- Method 1: Simple matching
 - m : # of matches, p : total # of variables

$$d(i, j) = \frac{p - m}{p}$$

- Method 2: Use a large number of binary attributes
 - Creating a new binary attribute for each of the M nominal states

Ordinal Variables

- An ordinal variable can be discrete or continuous
 - Order is important, e.g., rank (e.g., freshman, sophomore, junior, senior)
 - Can be treated like interval-scaled
 - Replace *an ordinal variable value* by its rank: $r_{if} \in \{1, \dots, M_f\}$
 - Map the range of each variable onto [0, 1] by replacing *i*-th object in the *f*-th variable by
- $$z_{if} = \frac{r_{if} - 1}{M_f - 1}$$
- นี่คือตัวแปรต่อไปนี้เป็นตัวแปรแบบอันดับ*
- Example: freshman: 0; sophomore: 1/3; junior: 2/3; senior 1
 - Then distance: $d(\text{freshman}, \text{senior}) = 1$, $d(\text{junior}, \text{senior}) = 1/3$
 - Compute the dissimilarity using methods for interval-scaled variables

นี่คือตัวแปรต่อไปนี้เป็นตัวแปรแบบอันดับ

นี่คือตัวแปรต่อไปนี้เป็นตัวแปรแบบอันดับ

นี่คือตัวแปรต่อไปนี้เป็นตัวแปรแบบอันดับ

Dummy

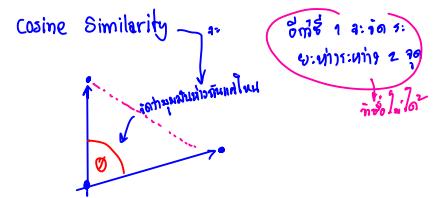

Attributes of Mixed Type

- A dataset may contain all attribute types
 - Nominal, symmetric binary, asymmetric binary, numeric, and ordinal
- One may use a weighted formula to combine their effects:

$$d(i, j) = \frac{\sum_{f=1}^p w_{ij}^{(f)} d_{ij}^{(f)}}{\sum_{f=1}^p w_{ij}^{(f)}}$$

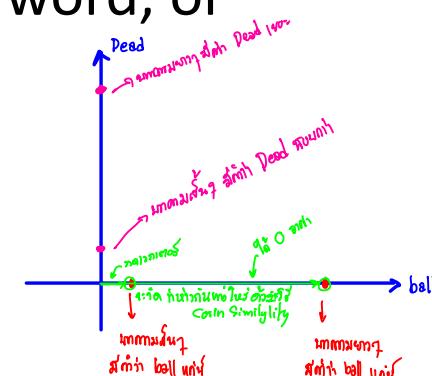

- If f is numeric: Use the normalized distance
- If f is binary or nominal: $d_{ij}^{(f)} = 0$ if $x_{if} = x_{jf}$; or $d_{ij}^{(f)} = 1$ otherwise
- If f is ordinal
 - Compute ranks z_{if} (where $z_{if} = \frac{r_{if} - 1}{M_f - 1}$)
 - Treat z_{if} as interval-scaled

Cosine Similarity of Two Vectors

- A **document** can be represented by a bag of terms or a long vector, with each attribute recording the *frequency* of a particular term (such as word, keyword, or phrase) in the document

Document	team	coach	hockey	baseball	soccer	penalty	score	win	loss	season
Document1	5	0	3	0	2	0	0	2	0	0
Document2	3	0	2	0	1	1	0	1	0	1
Document3	0	7	0	2	1	0	0	3	0	0
Document4	0	1	0	0	1	2	2	0	3	0

- Other vector objects: Gene features in micro-arrays
- Applications: Information retrieval, biologic taxonomy, gene feature mapping, etc.
- Cosine measure: If d_1 and d_2 are two vectors (e.g., term-frequency vectors), then

$$\cos(d_1, d_2) = \frac{d_1 \bullet d_2}{\|d_1\| \times \|d_2\|}$$

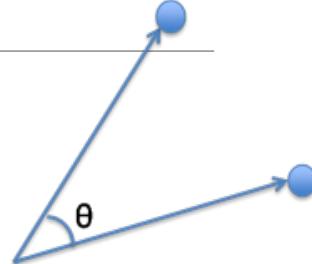

where \bullet indicates vector dot product, $\|d\|$: the length of vector d

Example: Calculating Cosine Similarity

- Calculating Cosine Similarity:

$$\cos(d_1, d_2) = \frac{d_1 \bullet d_2}{\|d_1\| \times \|d_2\|}$$

$$sim(A, B) = \cos(\theta) = \frac{A \cdot B}{\|A\| \|B\|}$$

where • indicates vector dot product, ||d||: the length of vector d

- Ex: Find the **similarity** between documents 1 and 2.

$$d_1 = (5, 0, 3, 0, 2, 0, 0, 2, 0, 0) \quad d_2 = (3, 0, 2, 0, 1, 1, 1, 0, 1, 0)$$

- First, calculate vector dot product

$$d_1 \bullet d_2 = 5 \times 3 + 0 \times 0 + 3 \times 2 + 0 \times 0 + 2 \times 1 + 0 \times 1 + 0 \times 1 + 2 \times 1 + 0 \times 0 + 0 \times 1 = 25$$

- Then, calculate $\|d_1\|$ and $\|d_2\|$

$$\|d_1\| = \sqrt{5 \times 5 + 0 \times 0 + 3 \times 3 + 0 \times 0 + 2 \times 2 + 0 \times 0 + 0 \times 0 + 2 \times 2 + 0 \times 0 + 0 \times 0} = 6.481$$

$$\|d_2\| = \sqrt{3 \times 3 + 0 \times 0 + 2 \times 2 + 0 \times 0 + 1 \times 1 + 1 \times 1 + 0 \times 0 + 1 \times 1 + 0 \times 0 + 1 \times 1} = 4.12$$

- Calculate cosine similarity: $\cos(d_1, d_2) = 25 / (6.481 \times 4.12) = 0.94$

Chapter 2. Getting to Know Your Data

- Data Objects and Attribute Types
- Basic Statistical Descriptions of Data
- Data Visualization
- Measuring Data Similarity and Dissimilarity
- Summary

Summary

សោរិក/នីត្តា
,

- Data attribute types: nominal, binary, ordinal, interval-scaled, ratio-scaled
ទម្រង់អ្នកស្ថាបនាអាជីវិក
- Many types of data sets, e.g., numerical, text, graph, Web, image.
- Gain insight into the data by:
 - Basic statistical data description: central tendency, dispersion, graphical displays
 - Data visualization: map data onto graphical primitives
 - Measure data similarity
- Above steps are the beginning of data preprocessing
- Many methods have been developed but still an active area of research

ចំណាំ: ជាក្រុងពីរប្រភេទ មិនមែន Data mining .
